Reworking Edge Mount Connectors

This document describes the recommended procedure for reworking (connector removal, site cleaning, and connector replacement) Samtec’s Edge Mount connectors using hot air rework equipment.

**Equipment Used:**
- Air-Vac DRS27 BGA/SMT rework machine
- Air-Vac hot air rework nozzle

**Other Materials:**
- Alpha OM-338 Pb-free, no-clean solder paste
- Kester TSF-6522 no-clean rework flux
- Mini-stencil

---

## Thermal Profiling

Prior to each process, a complete thermal profile study shall be completed. Thermocouples shall be placed directly beneath the center of the component as well as on the insulator body. The ideal process will replicate the temperature gradient and ramp rate as recommended by the solder paste manufacturer.

![Figure 1. Thermocouple Placement](image1.png)

**Process 1 – Connector Removal**

- Place board to be reworked on hot air rework machine.

![Figure 2. Board Placed on Rework Machine](image2.png)

- Align nozzle over component.

- Apply tacky flux to all accessible solder joints along the top and bottom side of the PCB.

![Figure 3. Flux Application](image3.png)
Reworking Edge Mount Connectors

- Run connector removal heating program.
- Once the nozzle lowers, adjust the Y axis location so that the nozzle straddles the edge mount connector.

After (removal) heating program is complete, quickly remove connector as nozzle rises.

Run site cleaning thermal program.
(Once site-cleaning nozzle is lowered, manually adjust table location until all pads have been cleaned, resulting in a flat surface with a thin coating of solder.)

Repeat site-cleaning program for PCB side 2.

If a site-cleaning feature is not available, a manual site-cleaning process is required. A manual process may be required for the edge mounted ground plane, if present.

Samtec Removal Program Settings*

Pre-heat board to 140°C
- Bottom heater – 325°C

Pre-soak
- Z-axis hot gas heater – 210°C, 85% flow
- Bottom heater – 275°C for 30 seconds

Soak
- Z-axis hot gas heater – 220°C, 85% flow
- Bottom heater – 275°C for 45 seconds

Ramp
- Z-axis hot gas heater – 250°C, 85% flow
- Bottom heater – 275°C for 30 seconds

Reflow
- Z-axis hot gas heater – 265°C, 85% flow
- Bottom heater – 275°C for 55 seconds

* Customer settings may be different
Process 3 – Connector Replacement

- Apply solder paste to the solder pads, on both sides of the PCB, using the Samtec recommended stencil aperture design and a stencil, mini-stencil or solder jet printer.

- For connectors with an edge mounted ground plane, apply solder paste to the solder pad on the edge of PCB using a solder gun, syringe or other direct application method.

* Customer settings may be different
