SCOPE

To perform the following tests: CCC/IR/DWV

APPLICABLE DOCUMENTS

Standards: EIA Publication 364

TEST SAMPLES AND PREPARATION

1) All materials were manufactured in accordance with the applicable product specification.
2) All test samples were identified and encoded to maintain traceability throughout the test sequences.
3) After soldering, the parts to be used for LLCR testing were cleaned according to TLWI-0001:
   a) Sample test boards are to be ultrasonically cleaned after test lead attachment, preparation and/or soldering using the following process.
   b) Immerse the sample test boards into the Branson 3510 cleaner which contains Kyzen Ionox HC1 (or equivalent) cleaning solution with the following conditions:
      i) Temperature: 55 Degrees C+/- 5 Degrees C
      ii) Frequency: 40 KHz
      iii) Immersion Time: 5 to 10 Minutes
   c) Sample test boards are then slowly removed and placed into the Branson 3510 cleaner which contains DI water with the following conditions:
      i) Temperature: 55 Degrees C +/- 5 Degrees C
      ii) Frequency: 40 KHz
      iii) Immersion Time: 5 to 10 Minutes
   d) Sample test boards are then removed and placed in a a beaker, on a hot plate with a magnetic stirrer containing DI water warmed to 55 +/- 5 Degrees C for 1/2 to 1 minute (Use 55 C as target)
   e) Upon removal, the sample test boards are then rinsed for 1/2 to 1 minute in room temperature free flowing DI water.
   f) After the final rinse, the sample test boards are to be dried in an air-circulating oven for 10 to 15 minutes at 50 +/- 5 Degrees C (Use 50 C as target)
   g) Sample test boards are then allowed to set and recover to room ambient condition prior to testing.
4) Any additional preparation will be noted in the individual test procedures..

ATTRIBUTE DEFINITION

Following is a brief, simplified description of each attribute measured.

THERMAL AGING

1) EIA-364-17B, *Temperature Life with or without Electrical Load Test Procedure for Electrical Connectors,* 125 degrees C, Condition B but for 300 hours.
2) Connectors are mated.

CYCLIC HUMIDITY

1) Reference document: EIA-364-31A, *Humidity Test Procedure for Electrical Connectors*, Method III, Test Condition B excluding Steps 7a, 7b [10 days, +25 deg C to + 65 deg C, 90% to 95% RH].

TEMPERATURE RISE:

1) When current passes through a contact, the temperature of the contact increases as a result of I^2R (resistive) heating.
2) The number of contacts being investigated plays a significant part in power dissipation and therefore temperature rise.
3) The size of the temperature probe can affect the measured temperature.
4) Copper traces on PC boards will contribute to temperature rise:
   a) Self heating (resistive)
   b) Reduction in heat sink capacity affecting the heated contacts
5) EIA-364-70A, *Temperature Rise versus Current Test Procedure for Electrical Connectors and Sockets*.
6) A de-rating curve, usually 20%, is calculated.
7) Calculated de-rated currents at three temperature points are reported:
   a) Ambient
   b) 60^{o} C
   c) 80^{o} C
8) Typically, neighboring contacts (in close proximity to maximize heat build up) are energized.
9) The thermocouple (or temperature measuring probe) will be positioned at a location to sense the MAXIMUM temperature in the vicinity of the heat generation area.
10) A computer program, *TR 803.exe*, ensures accurate stability for data acquisition.
11) Hook-up wire cross section is larger than the cross section of any connector leads/PC board traces, jumpers, etc.
12) Hook-up wire length is longer than the minimum specified in the referencing standard.

DIELECTRIC WITHSTANDING VOLTAGE (DWV)

To determine if the sockets can operate at its rated voltage and withstand momentary over potentials due to switching, surges, and other similar phenomenon.

1) PROCEDURE:
   a) Reference document: EIA-364-20B, *Withstanding Voltage Test Procedure for Electrical Connectors*.

Project Number: 027C	Tracking Code: 0133-027C-0498			
Requested by: W. Ouyang	Date: 8/16/01	Product Rev: Q/H Respectively

Part description: .8mm Double Row High Speed Connector Assembly			Qty to test: 8	
Test Start: 8/22/01	Test Completed: 9/20/01			

b) Test Conditions:
   i) Between Adjacent Contacts
   ii) Mated or Unmated
   iii) Mounted or Unmounted
   iv) Rate of Application 500 V/Sec
   v) Test Voltage (VAC) until breakdown occurs

2) MEASUREMENTS/CALCULATIONS
   a) The breakdown voltage shall be measured and recorded.
   b) The dielectric withstanding voltage shall be recorded as 75% of the minimum breakdown voltage
   c) .The working voltage shall be recorded as one-third (1/3) of the dielectric withstanding voltage (one-fourth of the breakdown voltage).

INSULATION RESISTANCE (IR)

To determine the resistance of insulation materials to leakage of current through or on the surface of these materials when a DC potential is applied.

1) PROCEDURE:
   a) Reference document: EIA-364-21B, *Insulation Resistance Test Procedure for Electrical Connectors*.
   b) Test Conditions:
      i) Between Adjacent Contacts
      ii) Mated or Unmated
      iii) Mounted or Unmounted
      iv) Electrification Time 2.0 minutes
      v) Test Voltage (VDC) corresponding to calibration settings for measuring resistances
2) MEASUREMENTS:
   a) When the specified test voltage is applied (VDC), the insulation resistance shall not be less than 5000 megohms.

TEST PROCEDURES / RESULTS

TEMPERATURE RISE:

1) High quality thermocouples whose temperature slopes track one another were used for temperature monitoring.
2) The thermocouples were placed at a location to sense the MAXIMUM temperature generated during testing.
3) Temperature readings recorded are those for which three successive readings, 15 minutes apart, differ less than 1 degree (computer controlled data acquisition).

DATA SUMMARY

- All test data is summarized in the following table. Only one set of derated curves for the samples is depicted. These curves represent the 'worst case' in that the highest temperature was detected in the respective tests (GP and Contact)
